AVC: Do you have any favorite vegan flavors? HW: Most of them just taste like coconut. I really enjoy the coconut ice cream at Magnolia Bakery in New York City. It's delicious. I can't have milk or cream, so I can't really drink any milkshakes, but there are other dairy-free milk options, so it's not that big of a deal. AVC: Why do you find people's comments about veganism or vegans so upsetting? HW: For most people, it's because they're afraid of change. They're afraid to change their lifestyle. They don't know what to do. The vegan food industry is growing so fast that the old ways of doing things are no longer relevant. But a lot of people in our industry are unaware of how progressive the vegan movement has become. It's been gaining a lot of traction. It's just a matter of time before people will start adopting a new way of eating. AVC: You've expressed a desire to run for Congress, but you've also done a number of local and regional political races. Do you have political aspirations for the national level? HW: I was always a political person before I was vegan. I remember I was writing a lot of letters to political figures. I also ran for the public office that I hold now. But I only ran because I felt like I had the interest and the expertise to do the job. I felt I was the best person to do the job. I was disappointed in the fact that I couldn't

A variety of fluids have applications in the fields of oil recovery and enhanced oil recovery, and in many cases it is desired that the fluid have a relatively high viscosity at relatively low temperatures. A variety of polymers, copolymers, and non-polymeric fluids are known to be useful as heavy-oil flooding fluids. For example, U.S. Pat. No. 4,429,001 and U.S. Pat. No. 4,761,343 describe the use of alkali metal or ammonium salts of unsaturated carboxylic acids, and U.S. Pat. No. 4,876,076 describes the use of polyacrylates. A variety of other water-soluble polymers are known to be suitable for use as oil-flooding fluids, including hydrolyzed polyacrylamides, as described in U.S. Pat. Nos. 3,351,488 and 4,774,302, and cellulose ethers, as described in U.S. Pat. Nos. 4,948,594 and 5,022,931. An ideal system for heavy oil recovery should have the following properties: high viscosity at reservoir conditions (about 200xc2x0 C. or higher); high thickening efficiency, i.e., low viscosity at reservoir conditions should be maintained after a considerable amount of polymer has been injected; injectivity (defined as the percent of injected polymer that is recovered at the end of the injection test), after 2d92ce491b
