As a result, there are no surprises when opening the program. But the biggest surprise for beginners and professionals is that, since the program was designed for use with photos, it is much easier to use than the official program. The simplified layout of the adjustment window, the new document function, and the simplified file navigation make it possible to edit photos without the need for reading a manual. The Adjustment window provides many useful tools. However, the number of tools varies depending on the adjustments to be made. Here are the tools that are generally used. Layers The Layers window is the starting point for editing the image and creating new layers. By default, the program contains seven layers, arranged in several groups. You can, therefore, easily select the appropriate layer for the situation and modify the position and order of the different layers. These layers are automatically arranged in the following order: Sky Background New Unmodified Color White Balance Raster Effects Sharpness An image with layers Each layer can have its own color. The colors of the various layers can be different. The properties of the various layers are therefore independent of the others. Each layer has different properties that allow you to modify it without influencing the properties of the other layers. **Brush Size** You can adjust the size of the brush size in the DAG (Brush Size dialog box). If you click the down arrow in the Brush Size box, a list of brush sizes appears. You can change the brush size using the following steps: Open the Brush Size dialog box by selecting Edit > Brush Size from the menu bar. Select a brush size by clicking the desired brush size. Click OK. Now try selecting your brush size from the Brush Size menu. You will notice that the brush size is successfully changed. Text Brushes are a great way to make text look rich and colorful. Photoshop supports various text brushes and can be used to create various text effects. Here are some commonly used text brushes: # Opacity You can choose to apply opacity to text so that the text blends into the background. Opacity can be used for various creative purposes. For instance, it can be used to create a drop shadow effect. It can be used to simulate a paintbrush stroke and make text look like watercolor. A nice application of opacity is to create a shadow by using the Brush tool and drawing around the text. # Bevel & Emboss The Bevel & Emboss tool is useful for making strokes, text and letters stand out. You can use various settings to give bevel and emboss brushstrokes unique looks and textures. Check out the Bevel & Emboss Effect category on the top of the Brush Size dialog box to find some cool brushes. # Blending and Smudging The term blending is used for when two colors get together to make a new color. You can create interesting images using blending techniques. You can use combinations of colors, shades of colors, or even transparency to create a variety of images. Smudging is the opposite of blending. In other words, it's when two colors get away from each other. For example, when you draw a hard brush stroke, the two colors (black and white) draw a new shape. Here are some Photoshop blending techniques: #Hard-Light #Hard-Shadow # Soft-Light # Soft-Shadow #Pattern or Color You can make images look "pop" by using various pattern or color effects. For example, you can use a pattern or color to create a watercolor effect, a grunge effect or a glow effect. # Channels The Channels palette gives you quick access to the Blue, Green, and

Q: What is the proper way to manage seeding users in Rails? My app allows users to signup and contribute. I'm looking to manage seeding users somehow, with something that will let me, as a developer, know when users have been created, given their id, for example. Not to mention my sanity. Does anyone have any recommendations on how I could better manage this situation? A: Generating unique ID's for each user is a good idea. Since you are going to populate one table you can add to it at the time of signup: Randomly generate a 32 bit integer. Use that as the primary key for the table. This allows you to populate the rest of the table without having to do anything extra - you already have that number as the key. It is also a very safe bet that at least one of your database users doesn't have a 32 bit integer ID (this is completely untested). Keep in mind that a 32 bit integer isn't that large of a number - you can have easily hundreds of millions of different records. Hence you want to be careful when picking a number and insure that it is not too large. The main issues I see with doing so are: It would cost you a lot of RAM (hence the reason for only doing it on the very first record you add). You might run into an issue in a future version of Rails. For example in Rails 3.x the query limit is set to 50,000 queries. So if you do this with every new record it could get to that limit before you have a chance to do much. So it is only a very minor advantage. My recommendation is to do it at the beginning of the app, but leave it out of the db.yml and only add it on the first record. A: Use Sequel ( and build the table yourself. With Sequel, you have access to the built-in Sequel::Table class, which allows you to define the unique columns of your table manually, and use Sequel's built-in ability to manage ID values automatically using MySQL's sequence generator. Then, all you need to do is to call Sequel::Table.insert() and Sequel will take care of the rest. Take a look at the Sequel tutorial if you
