PC Tools Password Utilities is a free utility that allows you to create random and complex passwords quickly, at the same time keeping them safe, as it is possible to keep an eye on the strength of your passwords and easily reveal any that you have been using in Internet Explorer. You can create passwords of different lengths (from 3 to 8 characters long) and add a special mix of characters, such as letters, numbers, punctuation, special characters, or ones that are not similar to others. You can also check the strength of the password by seeing the total number of characters, and the probability that any password generated by the program will be used. In addition, PC Tools Password Utilities reveals passwords saved in Internet Explorer, which allows you to view the autocomplete and the cookies options. You can also choose

whether to reveal the password or the autocomplete list. Last but not least, it is possible to test the strength of the password by using the Simple Password Strength Analyzer that works well with our program, generating passwords that correspond to the password strength requirements, and by comparing them to the actual password strength. We are confident that the time you spend browsing the web is about to increase as you can start using a password generator that is tailored specifically for your needs. PC Tools Password Utilities is a safe and reliable solution for creating random and complex passwords in a few clicks. Overall: It does exactly what you would expect, and it is clear what you need to do to create your passwords. It requires no downloads and is simple to use. What I Like: - It is very easy to use and offers a quick and effective solution for generating random passwords. - It allows you to easily and quickly test the strength of the

password and reveal passwords stored in Internet Explorer. What I Don't Like: - A minor issue, but it seems to hang when generating passwords with more than 7 characters. What Needs Work: - The software crashes when generating passwords with more than 7 characters, and when testing the strength of the generated password. - The software does not do a good job generating a password with the right number of characters, as it generates passwords containing random numbers that do not correspond to the password length requirement. - It does not do a good job generating a password with a password strength requirement higher than 8 characters. - If you select the "Only numbers" option in the Password Generator, then the generated passwords are sometimes not accepted by the Password Strength Analyzer

Q: Are there any differences between these two syntaxes for switch statement? I'm new to JavaScript and I'm trying to understand the difference between the following syntaxes of the switch statement.

```
var choice = prompt("Do you want to do something");
switch(choice) {
  case 'yes':
    console.log('Yes');
    break;
  case 'no':
    console.log('No');
    break;
  default:
    console.log('default');
    break;
}
```

```
var choice = prompt("Do you want to do something");
switch(choice) {
  case 'yes': console.log('Yes');
  break;
  case 'no': console.log('No');
  break;
  default: console.log('default');
}
```

Can someone explain? A: The first one is the "traditional"

switch statement. It's simply a bit more tedious to use. The second one is a "Modern" switch statement, which is the preferred option in JavaScript as of now.
