Photo editing app for iOS. Batch It converts, edits, crops, rotates, and resizes multiple photos in an easy to use interface. It can add captions, watermarks, and crop borders. Where to get Batch It: Free. Available on the iTunes App Store. Top 5 Free 3D Planner App 3D charting apps for iOS (iPhone, iPad, and iPod Touch) enable your users to explore their data in 3D. Many of these apps also have additional mobile data mapping features. For example, the map can be used to view and measure properties, roads, and streets in real-time. The 3D map can be used to review maps of a particular area, making it possible to see how far away a destination is or how many stairs there are to climb. By searching or filtering data based on properties, homes or businesses can be located easily. Q: Processing the Spatialite 3d geometries of a large set of csv files I'm trying to process a large set of csv files of geographic objects (polygons) and I'm looking for a way to process the geometry data in a fast way. The data set is of the order of several millions of records, so I'm looking for a way to optimise my computational time. My strategy is to read the files and to transform them into geometries. My code is the following. `import numpy as np
import csv
from shapely.geometry import shape, shapely, LineString
import geopandas as gpd
import geopandas as gpd
gdf = gpd.GeoDataFrame(gpd.read_csv("sample.csv", sep=";", encoding="latin1"))
X = gdf.geometry.apply(shape, dims=2)` The problem is that this takes quite a long time. I want to extract coordinates from the points, and this is not very efficient (about 1000 times slower than a regular shapefile parser I made in python). I tried to save each features in an array, but it's still too slow (about 10 minutes for 15 million records). Is there a way to process this efficiently? I'm open to other solutions (if it's the only way, I can't afford to use shapely. A: I'm assuming you are using pandas for

Q: PHP - How can I detect if a Class is inheriting a certain trait? I would like to detect if a given class inherits the SomeTrait trait. `class Test { use SomeTrait; }` If the Test class inherits the SomeTrait I would like to be able to execute a function. How can I achieve this? A: As of php7, you can use static method calls to do this. `use function \SomeTrait::someStaticMethod();` A: You can't. You need a workaround. But you're not the first one asking for that. Compar 1d6a3396d6
