to perform special actions. They consist of a graphic desktop element (menu, buttons, progress bar), a windows and a shell task. You can use the ShellTasks dialog to set the parameters of your task. * Fonts - You can set fonts for each Shell task

individually, also for each Shell icon. Shell objects can have their own icon. *

Windows Shortcuts - A Shell task with more than one window can also be used as a Windows shortcut, so that you can use a Shell task as an independent applet. This is

useful if you want to set up Shell tasks for shortcuts on the Desktop. * Desktop Objects - Desktop objects are new Shell objects which can be set as your new Desktop, Home, and/or Tray icons. * Shell Functions - Shell functions are powerful applications which

What's New in the ShellWM?

ShellWM is a small
replacement for the Win32
Shell with a number of new
features. Its interface is

designed to be very easy to use and should prove of no hinderance even to new PC users. The most important new features of ShellWM are listed below: 1) New icon scheme. 2) Win/Kill behaviour. 3) Quick access to external drives. 4) Deleted items

management. 5) Search, bookmarks, favorites and recent documents management. 6) SuperKaramba integration. 7) Integrated menu. Feature #1: New Icon Scheme By default, all entries of the taskbar have a separate icon. The 'main' one

is as shown in the image above. In most cases, it is a white background with a black letter, e.g. 'F'. The others are just 'windows' with a plus and minus icon. You can define a name for each entry and a shortcut key for each of them. Using the 'Edit entry' dialog,

you can add more than one entry of the same name. In such a case, the icon scheme will be mixed with the others. You can also specify which icon to use for the main entry.

Feature #2: Win/Kill

Behaviour When you click on an item of the taskbar, a

dialog appears. If you select 'Close the window', the application closes. If you select 'Close other windows', the windows of the application closes. If you select 'Open another window' or 'Open another folder', the application launches. Note that the actual

handling of the open windows is not totally the same:

ShellWM, for example, puts every application in the same open window. Feature #3:

Quick access to external drives When you right-click on a drive letter, you get the following menu: - 'Open

Windows Folder' - 'Open
Network Folder' - 'Open
Drive' - 'Open Disk' Note that
you can add new drives in this
dialog with a new entry. This
lets you access files in a
particular location from
Explorer. For example, if you
right-click on 'A' in the above

picture, you'll get the following menu: - 'Open Windows Folder' - 'Open Network Folder' - 'Open File'

Note that you can add new files in this dialog with a new entry. This lets you access specific files from Explorer. For example, if you right-click

on 'A' in the above picture,
you'll get the following menu:

- 'Open Windows Folder' -
- 'Open Network Folder' -
- 'Open File' - 'Open Folder' -
- 'Open Data Folder' Feature
