[Actual status of the surgical treatment of insulin-dependent diabetes mellitus (study of the author's clinic)]. Based on a review of 100 records of patients with diabetes mellitus treated in the Department of Diabetes Surgery of Medical University of Łódź from 1.1.93-31.12.96, the authors analyze the surgical treatment of diabetes. The most common type of resection of the pancreas is distal resection of the tail (44%). The authors' own experience in pancreatoduodenectomy and distal resection of the head of the pancreas (whole pancreatectomy) have been summarized. Among all resections the authors use Whipple procedure only in 1.3% of cases. The authors emphasize the usefulness of early diagnosis of diabetes mellitus. It permits primary resection to be performed in the form of distal resection of the pancreas in the early stages of diabetes. Diabetic patients with more advanced disease, undergoing resections of the pancreas, need to have intensive treatment of diabetes. Distal resection of the pancreas with or without splenectomy is a safe operation. The authors emphasize the necessity of careful selection of patients for pancreatoduodenectomy, which allows the possibility of primary resection of the pancreas in the early stages of diabetes mellitus. A Fully automated digital bank made in Python - SanderMak ===== SanderMak I created a tiny bank in Python for testing how well my Node.js app can do. While I was working on the website I realized that I could make this tiny bank in Python. That is the reason why I made it. This bank runs from scratch, making decisions like for example: Is the account balance enough to make a withdrawal or to make a deposit? Or will the minimum balance be reached next month? FRESNO, Calif. -- Shane McClelland had just been named coach at Fresno State. On Aug. 21, he landed his first recruit and the first true freshman to sign with the Bulldogs. He has been waiting his whole life for that moment. McClelland and the Bulldogs selected five-star right tackle
