The stock market is a true master of playing with your emotions and the key to understanding the markets is to know the rules that govern it. Atrial natriuretic factor and behavior. In this review we have compiled information on the neural, endocrine, and peripheral actions of atrial natriuretic factor, with special emphasis on the role of this peptide in the regulation of behavior. The atrial natriuretic factor is produced in secretory granules of the hypothalamus and, after they have been released, they stimulate the production of secretion of the hormone adenosine in the anterior pituitary gland. After secretion of the atrial natriuretic factor from the neurons of the supraoptic and paraventricular nuclei, the released peptide is regulated by certain drugs. The peptide has many biological actions; in addition to the well known natriuretic, antihypertensive, and diuretic effects, it causes an increase in heart rate and myocardial contractility and decreases blood and lymph flow in the periphery. Its action on the cardiovascular system is mediated by cGMP and it appears that this peptide plays a role in the regulation of certain endocrine secretions. The atrial natriuretic factor causes an inhibition of feeding in some species, although the sites of action in the central nervous system are not clearly defined. There is evidence that it stimulates food intake in other mammals, and there is also evidence that it produces an inhibition of feeding in both rats and hamsters. Certain other reports are conflicting. The atrial natriuretic factor also has effects on behavior, although the details of these are not well understood. Studies in our laboratory have found a role for the peptide in the regulation of the approach/avoidance response in cats. Q: How do I handle a toddler who doesn't like waiting? I have a 2.5 year old who is a very social child. He is a bit clingy, he is still a little shy. He does like spending time with me, but he also really doesn't like to wait. If he doesn't feel like he's needed, he doesn't want to hang around and if he doesn't feel like he has to be next to me he will not want to be in the same
