I've got a problem with a Firefox extension on my end (cannot quite remember which one) that has been causing a number of problems. Naturally, I want to get rid of it, but my options are pretty limited. Firstly, due to being a student, I don't have any free time, and I don't have friends with a C&C server. I'm not really in the mood for paying for software. However, I'd like to keep my coursework intact, which involves a lot of web browsing, so I've decided to use NoScript as a solution. However, the problem with it is that it is easily slow - like, at times, it can take up to fifteen minutes or more for a page to load, since it'll still sometimes go to the actual website, fetch the page, and then be told that the scripts from that page are prevented from executing. Additionally, because of this, I have not been able to continue with my coursework, and has also meant that I can't just go to another university to take a semester off - at least, not without being refused. I could try unplugging my network cable - though, the only outcome of this is that it'd take even longer for pages to load, and if it does, it's going to be somewhat slower. What I really want to do is break down the extension, unregister it from the Add-ons, and remove it from my personal Firefox cache, but I am unsure of how to even begin doing this. I've got the.xpi file, and I've found a few online websites that can help me find out what extension does, but these require, naturally, money, and I honestly don't have the money to spend on something like that. I've been browsing the Internet in order to get some replies, and I've found the answer to my problem - Tab Extender. Unfortunately, it seems I can't find any sites where you could get help with troubleshooting plugins, so I can only hope that I can fix the problem myself. I'd like to know of the other ways of fixing a problem with a Firefox extension. Since someone may think that this should be an "answer" rather than a "post", I'll post a short summary of the problem in this question. I'm trying to use a third

AfterFORMAT is a script developed by Artem Perminov that should cover the majority of users needs when coming back to Windows after a long time. The script allows users to install just about everything they owned previously or might want to install in the future. The control panel has been a neglected subject by both Microsoft and OS&Tools alike. For so long users have had to use the control panel through a series of dubious programs that may or may not accomplish what the control panel is supposed to do. Downloading and installing a specialized program that is supposed to give users access to the Windows control panel is the only way this feature is accessible. As we've seen, it is actually possible to get to the control panel via the start menu and the all apps list, but that is not the case for most users. For those users who have tried multiple programs in the past that

were supposed to be the ones to give them access to the Windows control panel, many of them are failing. So, we thought about creating a control panel that would work no matter what tool, application, or browser you use. The control panel software is free and does not require any additional applications or add-ons. It is easy to use. There is no need to be a computer genius to navigate the control panel – all it takes is just a click on an option and that's it. It just works, and users don't have to go through any settings or macros to make it work. Selecting the desired application is the only thing one needs to do in order to add it to the Windows control panel. This tool tries to remain as compatible with the Windows operating system as possible, so you won't face any issues when trying it. Control panel is a Windows feature included in OS&Tools application that simplifies managing important elements of Windows XP, such as adjusting the settings for things like the clock, date, and volume. The control panel is a program that loads when you start the computer and gives you access to several different things. Once you have the control panel you can access the most common elements of the operating system from there. The control panel usually is found in Programs>Programs. It has several different parts to it. You can change the settings for your shortcuts, your volume, your network configuration, your date and time, as well as several other things. It has 3 main parts, which is described below. The most useful part of the control panel
